Presentation verification

Verification of the submission deck, the screencast and the demo driver against the nine requirements from the organizers. Artifacts under examination: the deck source `presentation/Презентация Madrigal Protocol Lab.html`, its light twin `presentation/Презентация Madrigal Protocol Lab (светлая).html`, the committed `presentation/slides.pdf` and `presentation/slide-light.pdf`, the PPTX builds `presentation/slide.pptx` and `presentation/slide-light.pptx`, and `presentation/defense_script.md`. Nothing was rebuilt from a template; the PDFs are printed from the HTML and the PPTX is generated by our own code.

Reproduce any line below with the command in the same row.

Deck

fact	value	command
pages in the committed PDF (dark)	15	`pdfinfo presentation/slides.pdf`
pages in the committed PDF (light)	15	`pdfinfo presentation/slide-light.pdf`
slides in the source	15	`grep -c 'class="slide-container"' presentation/*.html`
slides in the PPTX	15	`python -c "import zipfile;z=zipfile.ZipFile('presentation/slide.pptx');print(len([n for n in z.namelist() if n.startswith('ppt/slides/slide') and n.endswith('.xml')]))"`
page size	2560 x 1440, 16:9	`pdfinfo presentation/slides.pdf`
empty pages	0	render scan below
DejaVu / fallback glyphs	0 (fonts are inlined in the HTML)	render scan below

The source and both PDFs agree on the set of slides, and the team slide is page 2 in all of them. The light PDF is the same markup with the surfaces lifted and the accent kept; layout and copy are identical between the two themes.

Per-page headings, from the source HTML:

```
 1  Восстановление недокументированного бинарного протокола поверх TCP
 2  Нас двое
 3  TCP разрезает сообщения посередине
 4  Дано и требуется
 5  Путь исследователя
 6  Три модуля связаны форматами, а не вызовами
 7  Гипотеза ≠ Правило
 8  От интерпретации можно вернуться к исходным данным
 9  Правило проверяется на всём корпусе сразу
10  Контрпример важнее метрики
11  Что получилось: 60 из 140 → 140 из 140
12  Набор организаторов разобран целиком
13  Демонстрация: живое окно и запись прогона
14  Границы применения и итоги
15  Инструмент превращает байты в проверяемое знание
```

No page is blank; each carries a heading or a section number.

The nine organizer requirements

#	requirement	present	PDF page
1	Тема	yes	1
2	Состав команды с фото и ролями	yes	2
3	Технический стек	yes	1
4	Архитектура	yes	6
5	Функционал и киллер-фичи	yes	8, 9, 10
6	Скриншоты или скринкаст	yes	13
7	QR на GitHub	yes	15
8	Демонстрация отдельным блоком	yes	13
9	Направления развития	yes	14

Nine of nine present.

- Requirement 3: the stack line «Python 3.12 · PySide6 · dpkt · pytest · Docker» sits on the title slide.
- Requirement 4: the «Три модуля» slide shows the module breakdown and the JSON Schema contracts; the «Путь исследователя» slide shows the pipeline.
- Requirement 6: the demo slide (13) embeds the committed screencast (`presentation/screencast.mp4`) as a `<video>` element with the poster frame, `controls`, `autoplay`, `loop`, `muted` and `playsinline`. The clip is inlined as a `data:video/mp4` URI, so the HTML deck plays it with no web server; the printed PDF and the PPTX carry the poster frame. The deck carries no standalone GUI screenshots; the still screenshots live in `presentation/screenshots/` and are used by `README.md`, not by the deck.
- Requirement 7: `presentation/public/qr_repo.png` and `qr_release.png` are referenced by the closing slide and decode to the repository and the `v1.2.0` release; the per-member Telegram codes decode to `@Pasha1778` and `@petruan`. All four codes were decoded from the rendered PDF, in both themes.

Every image reference is inlined in the HTML as a `data:` URI, so the deck opens and prints without a web server and without the rest of the repository.

Final slide

Slide 15 is a closing slide, not a "Вопросы" slide. It carries the one-line conclusion «Инструмент превращает байты в проверяемое знание», the repository line with its GitHub glyph, the two QR codes (repository and release) with captions, and the contact line with both members' Telegram handles. It carries no technical metric — no test count, no coverage figure, no release asset count — and the word «Вопросы» appears nowhere in the deck.

Client identity

The public identity of the case owner is carried on the first and last slides only. Both show the «Мадригал» wordmark, generated by `presentation/make_brand.py` as `presentation/assets/madrigal-logo.png` (960x232). The square `madrigal-mark.png` is used as a small watermark next to the wordmark. On the dark theme the marks are rendered as light artwork so they read on the dark background; on the light theme the dark originals are used.

PPTX

fact	value	command
slides	15, 16:9	`python -c "import zipfile;print(len([n for n in zipfile.ZipFile('presentation/slide.pptx').namelist() if n.startswith('ppt/slides/slide') and n.endswith('.xml')]))"`
per slide	one full-bleed image, the rendered page	python-pptx scan
zip timestamps	pinned to 1980-01-01	`python -c "import zipfile;print({i.date_time for i in zipfile.ZipFile('presentation/slide.pptx').infolist()})"`

The PPTX carries the deck as one rendered page per slide, so it reproduces the design exactly but its text is not selectable. The editable source is the HTML; the PPTX is the portable, presentation-ready copy.

Fonts

The deck asks for Tektur (headings, the wordmark), Montserrat (body) and JetBrains Mono (code, handles, the byte line). The `.ttf` files ship under `presentation/public/fonts/` and are inlined into the HTML, so a machine without the families installed still shows the deck's own typefaces. The GUI uses the same families through `src/ui/theme/fonts.py`.

Screencast

fact	value	command
committed file	`presentation/screencast.mp4`	`git ls-files presentation/screencast.mp4`
served copy	`presentation/public/screencast.mp4` is a symlink to it	`ls -l presentation/public/screencast.mp4`
codec, size	H.264, 1920x1080	`ffprobe presentation/screencast.mp4`
duration	3:40	`ffprobe presentation/screencast.mp4`
shown on	embedded on slide 13 as `<video src="data:video/mp4;base64,...">`	`grep -c '<video' presentation/*.html`

The clip is embedded in the demo slide (13): the element carries the poster frame, `controls`, `autoplay`, `loop`, `muted` and `playsinline`, and the clip itself is inlined as a `data:video/mp4` URI, so the deck plays it without a web server and without the rest of the repository. The printed PDF and the PPTX show the poster frame. `presentation/public/screencast-poster.png` is kept in `public/` so a still frame can be reinstated without re-running `make_assets.py`.

Demo driver

`presentation/record_demo.py` drives the real window through the demo scenario and pauses between steps so the take reads as a demonstration. It adds nothing to the product and imports only the public window entry points.

Text hygiene

- No `TODO`, `FIXME`, `XXX` or `HACK` in the source, tests, scripts or docs held in the repository.
- No token, key or credential appears anywhere in the working tree or history. `ghp_` and `github_pat_` occur only inside the audit documents that describe the scan itself.
- The deck, the docs and the code name no assistant, model or generator.
